## Energy Video Possible Scenario Descriptions

1. Starting from rest, a box of mass $\boldsymbol{m}$ slides down a ramp of height $\mathbf{h}$. While the box is on the ramp, it experiences an average force $\mathbf{F}$. The length of the ramp is $\mathbf{d}$, and the box comes to rest at the bottom.
2. A mass $\boldsymbol{m}$ at a height $h$ is moving at a velocity $\mathbf{v}$. After a period of time, the mass has fallen to ground level, and its motion has ceased because the mass has compressed a spring a distance $\mathbf{x}$. The spring constant is $\mathbf{k}$.
3. A mass $\boldsymbol{m}$ is initially moving with a speed $\mathbf{v}$. A short time later, the mass has moved upward a height $\mathbf{h}$, and it has come to rest after stretching a spring a distance $\mathbf{x}$. The spring constant is $\mathbf{k}$.
4. A spring stretched a distance $\mathbf{x}$ and with a constant $\mathbf{k}$ is used to launch a mass $\boldsymbol{m}$ horizontally with a maximum speed of $\mathbf{v}$.
5. A force $\mathbf{F}$ is applied to a mass $\mathbf{m}$ over a distance $\mathbf{d}$, causing the mass to move upward a height $\mathbf{h}$ without a change in its speed.
6. Mass $m$ is initially at rest on the ground. A force $\mathbf{F}$ is applied to mass $m$ over a distance $d$, causing three changes: the mass moves upward to a height $\mathbf{h}$; a spring with constant $\mathbf{k}$ gets stretched a distance $\mathbf{x}$; and the mass moves with a speed $\mathbf{v}$.
7. A mass $\mathbf{m}$ with an initial speed $\mathbf{v}$ gains a height $\mathbf{h}$, coming to rest in the process.
8. A mass $\boldsymbol{m}$ at a height $\mathbf{h}$, moving at a speed $\mathbf{v}$, moves to ground level and comes to rest, experiencing an average force $\mathbf{F}$ over a distance $\mathbf{d}$ along the way.
9. A force F is applied over a distance d , causing a spring with constant k to be stretched a distance x .
10. A mass $\boldsymbol{m}$ with speed $\mathbf{v}$ comes to rest while gaining a height $\mathbf{h}$ and experiencing negative work done by a force Fover a distance d.
11. A mass $\boldsymbol{m}$ is launched from rest by a spring with constant $\mathbf{k}$ and a compression distance $\mathbf{c}$. The mass experiences negative work done by a force $\mathbf{F}$ over a distance $\mathbf{d}$, gaining a height $\mathbf{h}$ and attaining a speed $\mathbf{v}$ in the process.
12. Starting from rest, a mass $\mathbf{m}$ loses height $\mathbf{h}$ and experiences positive work by a force $\mathbf{F}$ over a distance $\mathbf{d}$. The mass reaches a final speed of $\mathbf{v}$.
